

BRONQUIAVIAR

DESCRIPTION

Alive attenuated vaccine of virus Massachussets H- 120 strain.

TECHNICAL PROPERTIES

Infectious aviar bronchitis is produced by the corona virus and has important economical repercussions due to the respiratory infections and the delay in growth it causes in broilers. In layers it also causes production losses.

This virus is widespread, so vaccination is necessary and mainly done with inactivated and attenuated life vaccines especially of the H-120 and H-52 strains. The Massachussets H-120 strain is the first vaccination with few reactions.

INDICATIONS AND SPECIES

Intended for the prevention of aviar bronchitis in:

- Broilers from 1 day to 3 weeks old.
- Layers of 7 weeks old.
- Breeders of 7 weeks old.

COMPOSITION

10⁶ DIE- 50 Virus Massachussets H- 120 strain

DOSAGE

Orally: Once the vaccine is reconstituted, it is administered with the amount of drinking water that will be consumed within 2 hours (15 litres of water for every 1000 broilers of 3- 4 weeks and 40 litres for the same amount of broilers older than 4 weeks). To improve the stability of the product it is recommended to add 1 gram of fat free milk to the water.

Aerogen route: Perform nebulization with a 500 ml solution every 1000 doses. Poultry must be kept a minimum of 20 minutes in this environment.

In all cases one dose per animal must be administered. In large populations the vaccination schedule must be established under veterinary criteria depending on the epidemiology of the area.

CONTRAINDICATIONS

Do not administer to sick or feverish animals. 5- 7 days after administration a vaccination reaction can appear that can be distinguished by respiratory noises.

PACKAGING

1000 and 2500 doses.

WITHDRAWAL PERIOD Not needed.
