

PRETIMPAN

DESCRIPTION

Suspensible oral powder with antibloat properties for the treatment of rumen imbalances in ruminants.

TECHNICAL PROPERTIES

The chewing process is a model of the microbiological balance where several species of bacteria feed from a fibrous base and produce a nutritive large pill prepared to be digested later on. This equilibrium can be disturbed because of changes of feed, ingestion of cold feed, feed too rich in legumes, feed contaminated with bacteria or toxins or after antibiotic treatments that disturb biota. The consequences of any of this changes are stop of chewing, putrefaction biota growth and gas production. These cause a foam, that can not be removed in esophagus finishing in a reticular-ruminal and abdominal distension.

To establish the good balance there are three combined actions: correction of diet, antibloat administration (methylsilicone) and antibiotic administration to kill putrefaction biota (like penicillin)

To establish the good balance three actions should be combined together: correction of the diet, administration of antibloats (methylsilicone) and administration of antibiotics to kill the pathogenic microbiota (like penicillin).

INDICATIONS AND SPECIES

Intended for sheep, goats and cattle in the treatment of meteorism (gas accumulation in rumen expanding ruminal walls), indigestion and ruminal overload.

COMPOSITION

Methylsilicone	50 mg
Penicillin G procaine	37500 I.U
Excipient to	1 g

DOSAGE

It is administered orally (after shaking) diluted in half a litre of water or chamomile, with a bottle and a dosing spray pistol at doses of:

- Sheep and goats: 30 grams a day in one dose.
- Lambs: 15 grams a day in one dose.
- Cattle : 250 grams a day in two doses.
- Calves: 125 grams a day in two doses.

CONTRAINDICATIONS

Do not administer to animals hypersensitive to penicillins.
